**June 19, 2024**

## Executive Summary

Prior studies performed by 1790 Analytics have demonstrated a strong relationship between IEEE research and new patent development and have shown that citations to IEEE can often lead to higher impact patents. Specifically, the impact is measured by examining the extent to which patented inventions build upon papers from IEEE journals, IEEE-sponsored conferences, and IEEE standards. This is an update of previous reports and examines US patents issued from January 1, 2004 through December 31, 2023.

The main findings of this report are:

- New technology continues to build upon science, and the dependence is increasing. In this study, the top 50 firms (in 2023) were granted 84,259 patents, which made a total of 653,229 non-patent references (an average of 7.75 non-patent references per patent). Back in 2011 the top 25 firms were granted 51,826 patents. These patents made a total of 205,634 non-patent references, (an average of 3.97 non-patent references per patent) Thus, the number of patents is trending upward but the number of references from those patents is rising at a greater rate. Since many these non-patent references are to scientific articles and conference papers, this suggests that today's technology developments are increasingly linked to developments in published science.
- A large portion of this science base comes from papers presented at IEEE sponsored conferences and published in IEEE journals. The top 50 patenting firms in 2023 have referenced 2,706,789 articles in the last 20 years. About 25% (682,113) of those articles appeared in IEEE journals, IEEE sponsored conferences or IEEE Standards Documents (see Figure 2).
- In this study, we also went beyond the top 50 patenting companies and analyzed all patents from the last 20 years in several technology categories of interest to IEEE members and customers. For example, over 30% of all scientific references from Computer Hardware patents go to IEEE publications. The second most referenced publisher is ACM (Association for Computer Machinery) with 16.5% of the referenced publications. In other Information Technology areas, such as Information Storage, Semiconductor Manufacturing, and Computer Software, the results are similar.
- In Telecommunications technology, IEEE is particularly impactful. The 737,376 references to IEEE articles, conferences, and standards represent about 34% of all Non-Patent references (NPRs) from Telecommunications patents since 2004. However, Telecommunications references contain a higher number of standards than other technologies which understates the extent to which IEEE provides the science base to this technology. If we remove the standards from the NPRs then of course IEEE loses about 74,000 references to its 802 wireless standards, however, the 663,000+ remaining references to IEEE journal articles and conferences represent almost 50% of the total science references from Telecommunications patents. In

other words, IEEE provides half of the science base for new innovations in Telecommunications.

- Although we've generated reports like this for over two decades, we try to add technology categories that are currently hot or emerging. In recent years we've added Blockchain and Distributed Ledgers, Cybersecurity, and Virtual and Augmented Reality. In these emerging areas, IEEE receives the most references and enjoys roughly a 2-fold lead over second place ACM.
- We also have three other areas containing older technologies that are having a renaissance (Artificial Intelligence (AI) and Machine Learning, Autonomous Vehicles, and Internet-of-Things related patents). In each of these areas IEEE is the dominant publisher of the science base. In AI, IEEE enjoys more than a 3-fold lead over second place ACM. In Autonomous Vehicles, IEEE has a dominant lead (10-fold lead) over the second-place entry RELX/Elsevier. In the Internet-of-Things category IEEE has almost a 3-fold lead over second place 3GPP.
- In the Robotics and Intelligent Manufacturing category, 37% of the patent references are to articles published in IEEE journals or in proceedings of IEEE sponsored conferences. Second place RELX receives about one-fourth as many references in the category.
- IEEE is referenced a surprising amount in areas which are not central to its mission.
  - In broadcasting technologies IEEE leads with 30.07% of the references, which is about 2.5 times as many as second place International Telecommunication Union. The latter produces standards documents while the IEEE references are to standards documents as well as peer reviewed scientific papers from journals and conferences.
  - 8.01% of the science references from patents in medical devices go to IEEE publications. This ranks IEEE fourth behind RELX and Wiley, and Wolters Kluwer (with 19.94%, 9.91%, and 8.45% respectively). These publishers have hundreds of journals in the medical area, whereas IEEE has only a few, so the 8.01% figure is quite solid for a non-core area and not far behind second place Wiley's 9.91%.
  - Optics is also somewhat surprising. The two optics societies: OSA – The Optical Society of America, and SPIE – The International Society of Optical Engineering sponsor many conferences and have several journal articles, but OSA has only a slight lead over IEEE which has a slight lead over SPIE. Specifically, OSA receives 16.88% of the references, IEEE receives 13.61% and SPIE receives 12.54% of the references from optics related patents.

- In Measuring, Testing, and Control, IEEE gets 19.00% of all references, which ranks ahead of the 14.58% of second place RELX while, again, RELX has many more journal titles in the space.
  - Patents related to Power Systems and Transmission also reference IEEE publications most frequently. The 73,283 references to IEEE journal and proceedings papers are more than the next two top referenced publishers (RELX and American Chemical Society) combined. We also examined a specialized subset of the Power Transmission category related to smart meters and smart grids. In this category, 52.30% of the scientific references from patents go to IEEE journal or conference papers. The second most referenced publisher is RELX with only 9.59% of all references.
- Several years back we started tracking some green energy categories: Solar and Photovoltaic energy and Wind energy. In the Wind category IEEE science has a big advantage over the other publishers with more than 39% of the references. In solar energy, IEEE has a smaller lead over RELX. IEEE leads RELX even though RELX has 50+ journal titles related to the area including several high impact journals such as *Solar Energy Materials and Solar Cells*, *Thin Solid Films*, *Solar Energy*, *Synthetic Metals*, *Journal of Crystal Growth*, and *Solar Cells*, while IEEE has only a few titles.
- It has been shown that high-quality, high-impact, and valuable patents tend to be cited more frequently by later patents. Citation impact is thus often used as a quantitative measure for evaluating patents (see [3]). In this study, we found that the patents that reference IEEE papers are cited more often than patents that do not. This was shown to be true for each of the twenty technology categories we examined. This suggests that, not only do IEEE publications frequently provide the science base for new inventions, but that inventions that build upon IEEE publications are more likely to be valuable in the future than inventions that do not build upon IEEE.
- Although this study concentrates on patents in specific technology areas, it should be noted that the importance of scientific and technical literature to patented technology is increasing in all areas. Our research shows that the average US patent had only 2.76 non-patent references (NPRs) back in 1997. That number jumped to 13.07 by 2023 – a 373% increase. These numbers are for all issued US patents and not just those in the twenty categories covered in this report.<sup>1</sup> This means that in the overall patent system, patented technologies are increasingly referencing scientific articles.
- Since we only look at specific categories of technology plus the top 50 firms, there is no way to know exactly how much referencing to IEEE has increased since 1997. However, we can make an estimate for the whole patent system by identifying any Non-Patent References that mention “IEEE” or “I.E.E.E.” (This will of course miss things like the *Journal of Lightwave Technology* or *Spectrum* which may not have

---

<sup>1</sup> Including science intensive areas like Biotechnology, Pharmaceuticals, Chemicals, and other areas where IEEE typically has less influence.

IEEE in the reference, but it will be a reasonable estimate.) If we do a comparison as above, we find that there were just 14,635 patent references with IEEE or I.E.E.E in 1997, but 141,081 in 2023 (an 864% increase). Thus, science referencing and IEEE referencing have both increased greatly since 1997.

## I. Introduction

In previous studies, it was found that patents reference papers from IEEE journals much more often than papers from other journal publishers. In this report, we update the previous results, and study US patents issued from January 2004 through December 2023. Although this report is an update of previous results, we have made our best efforts to make this report self-contained. The aim of this report, as in previous reports, is to analyze references from patents to journal articles, conferences, and standards documents, in order to assess IEEE's impact upon technological developments.

This report covers twenty subcategories of Technology where IEEE members and readers are active. Many, but not all are related to Information Technology. The categories patent counts are shown below in Table 1.

Table 1: Number of Patents for Each Category Covered in this Study

Category	# Patents 2004-2023
Artificial Intelligence and Machine Learning	59161
Autonomous Vehicles	12127
Blockchain/Distributed Ledger	6611
Broadcasting	234309
Computer Hardware	549709
Computer Software	334261
Cybersecurity	180237
Diagnosis/Surgery/Medical Instruments	275325
Information Storage	128482
IOT/Internet of Things	23488
Measuring, Testing and Control Devices	254727
Optics/Photography/Electrophotography	163164
Power Systems	156704
Robotics and Intelligent Manufacturing	45816
Semiconductors/Solid-State Devices/Electronics	336029
Smart Grid/Smart Meters/Energy Infrastructure	5114
Solar/Photovoltaic	16384
Telecom and Other Communications	802131
Virtual/Augmented Reality	29227
Wind Energy	10416

## II. Methodology

This study is based on referencing patterns from patents to prior art documents. When an inventor files a patent for an invention, he/she will typically reference earlier documents to show that the new invention either builds upon, or improves upon, what came earlier. The inventor's patent attorney and/or the examiner may also add prior art references to either clarify or limit the claims of the invention.

As an example, Figure 1 shows the front page of a patent owned by IBM. The prior art references on this patent come in two forms - references to earlier patents, and “other references”. These other references are often to scientific publications, such as those produced by IEEE. In this report we are primarily concerned with these other references, which are also sometimes called “Non-Patent References”.

It has been suggested that patents with many non-patent references are likely to contain new leading-edge ideas, whereas patents that only reference earlier patents are likely to be incremental improvements on earlier patented technologies. For a comprehensive study on various hypotheses surrounding the motivations of inventors in citing other references, see [1].

### ***Patent Sets used in the Analysis***

This study is based on two patent sets. Our analysis is based on determining the number of references from these patent sets to publications from publishers such as IEEE, RELX (formerly Elsevier), the American Institute of Physics, and others.

The first set contains patents from the top 50 patenting companies in 2023. Analysis of this patent set provides an insight into how the top tier companies rely upon science from IEEE and other publishers. The second set contains all patents in twenty technology categories from all companies, universities, government agencies, and individuals. The twenty technology categories examined are shown in Table 1 above. Analysis of this patent set reveals the wider influence of IEEE science in these technologies.

### ***Identifying Relevant Non-Patent References***

Non-patent references can be to any published document, from comic strips and brochures, to scientific articles and standards documents. The main difficulty in identifying relevant non-patent references for a study such as this is that inventors do not use a standard form for listing references. As an example, Table 2 contains eight different variants for the IEEE Global Telecom Conference. Note that some inventors just use the GLOBECOM shorthand, while others list the entire name. Sometimes IEEE is mentioned and sometimes it is not. When abbreviation variations are included such as Telecom, Tele, Tcom, Proc., Proceed., the number of variants increases further. The same issue exists for variants in journal names and standards documents. For example, there are more than 30 variant spellings of the journal title *Journal Of Thoracic And Cardiovascular Surgery* including numerous misspellings of thoracic and every conceivable way of abbreviating cardiovascular.

**Table 2 – Variants for IEEE Global Telecom Conference**

Proc of the Global Tele Conf, U.S. New York, IEEE

**Conference Identification** – to identify conference proceedings among the non-patent references, we first identified references containing keywords such as meeting, symposia, conference, etc. We then used parsing software to identify 2-word and 3-word phrases that appear frequently in this set of papers. The full string was identified for these string subsequences to identify frequently cited conferences. In this way, we identified the top conferences referenced in the patent sets, and standardized the names of these conferences (i.e., all the different variants of a conference were collected under a single name). As an example, Table 2 shows 8 of the 95 variant names for IEEE Globecom which are unified to the name ‘<conf> IEEE Global Telecommunications Conference (GLOBECOM)’ in this report and the underlying analysis database.

We look up each of these conferences on the web to determine who is listed as their primary sponsor. For example, many of the conferences are sponsored by organizations such as IEEE, ACM (Association for Computer Machinery) and ASME (American Society of Mechanical Engineers). Some conferences are jointly sponsored by multiple organizations and this is noted as well.

When we first started identifying conferences in the 2005 report, we looked up the top 100 most referenced conferences to identify the primary sponsors or hosts. In this current report we track the top 2,000+ conferences which appear under some 40,000 variant names.

**Standards Identification** – Standards documents are increasingly referenced, and in general they are easy to identify by looking for strings such as ‘standard’ or ‘std’. Once the records containing the standards were located, it is straightforward to identify the organization that produced each standard (ITU, IEEE, ISO, JEDEC, ANSI, etc.). Further, once the standards bodies are identified, we then identify references to other documents that do not specifically list the words ‘standard’ or ‘std.’ The latter step is necessary since some references look like this “ISO/TC97/SC21/N2066” or “IEEE 802.3” without a specific mention of the word “standard.” As a consequence, we also identify other non-standard documents released from these organizations including draft standards and “requests for comments” documents if they are cited by patents.

**Journal Identification** – identifying and standardizing journal names is a very difficult process because there are so many different journals, and their names can be abbreviated in many different ways. To make the problem more manageable, we base our analysis primarily to the 45,000+ journals covered by the combined databases of ISI/Clarivate, Elsevier/SCOPUS, and 1790 Analytics, LLC. This is not a severe limitation, since these databases include more than 200 IEEE journals, transactions, and magazines, 3,000+ RELX/Elsevier journals, and 1,200 Wiley journals. In addition, we also identify publishers of about 1,000 non-ISI, non-SCOPUS journals if they appear very frequently in the patent references, but do not appear in these databases.

Once restricted to these 45,000+ journals, we used software that transforms journal names into common abbreviations and then implements string matching. Care must be taken with string matching because, for example, searching for “Urology Journal” will also accidentally identify “Neurology Journal”. Similarly, a search for the journal “Science” would accidentally pick up

any reference with ‘science’ in the paper title as well as any of the 800+ journals with science in their titles such as “Game and Wildlife Science”. Our proprietary software for journal identification (along with some human intervention) deals with these problems, so that we generate an accurate match between the patent references and 45,000+ journals. After identifying all relevant journals, we then used the Clarivate and SCOPUS databases and web research to identify the publisher of each journal

### III. Results

#### *References from Top 50 Patenting Organizations*

Table 3 shows the 50 firms that were granted the largest number of US patents in 2023. It should be noted that many of these firms consist of multiple subsidiaries, and these firms patent under many names. (For example, General Electric has patents filed under 316 names, of which only a fraction contain General Electric in the name.) We identified all the subsidiary names for each company to ensure that our patent counts are accurate.

We identified the top 50 patenting firms because we want to understand the extent to which the current technology leaders use IEEE science. Figure 2 shows the 20 publishers of science whose publications are referenced most frequently by the 50 firms shown in Table 3. This figure shows that patents issued to the top 50 firms between 2004 and 2023 reference IEEE papers, conferences, and standards 682,113 times. This is nearly three times as many references as the second placed publisher RELX/Elsevier.

IEEE receives 25.2% of the science references from the patents of the top 50 companies. The next closest publisher (RELX/Elsevier) has 8.78% of the total.

Table 4 illustrates the reference distribution of IBM, which is second in patenting in 2023, but holds the most patents for the 20 year period from 2004-2023. This reference distribution is typical of the top 50 firms. The references from IBM to IEEE are to several different IEEE journals and conferences. In this table, IEEE journals are highlighted in yellow and IEEE conferences are highlighted in orange. The top overall reference is to IP.com which has a technical disclosure database of prior art that is often referenced by companies. IBM also references several internet standards frequently.

Notice that 31 of the top 70 journals and conferences referenced by IBM patents are published or sponsored by IEEE. Fifteen of the top 70 journals and conferences are published or sponsored by ACM. (Six of the fifteen are jointly sponsored between ACM and IEEE.) Since it’s primarily a software services firm, IBM tends to reference ACM much more than most of the top 50 firms, but still IBM references IEEE nearly twice as often as ACM as seen in Appendix A-10 (72,712 references to IEEE and 39,592 references to ACM.) The reader may notice the large number of references to ‘IEEE Unseparated’ or ‘Misc ACM’ in Table 4. These are articles that reference IEEE or ACM, but the inventor has not given a reference specific enough to identify the proper journal or conference. A few examples can be found in Table 5 below.

**Table 3 – Top-Patenting Firms in 2023**

<b>Rank</b>	<b>Full Parent Name</b>	<b>2023 Patent Count</b>	<b>2004-2023 Patent Count</b>

### ***References from Companies in Twenty Technology Categories***

In the previous section, we analyzed the use of IEEE science by the top patenting organizations. Out of all science publishers, IEEE was cited most often by these organizations by a wide margin. However, looking only at the top companies tells an incomplete story. IEEE publishes journals and runs conferences mainly in information technology, electronics, and related areas. It is therefore useful to examine the extent to which IEEE science is referenced by all organizations that patent in specific technologies and not just by the leading companies.

As mentioned in the methodology section, we identified all patents in the twenty technology categories shown above in Table 1. 1790 Analytics has developed a classification scheme that categorizes all patents into 50 broad technology areas based on International Patent Classes (IPCs) and Cooperative Patent Classes (CPCs) which are assigned to each patent as part of the examination process. This scheme was used to identify all relevant patents for the current analysis.

We examined each of the technology areas separately, and the results are summarized in Figures 3-19. The first category shown (in Figure 3) is Artificial Intelligence (AI) and Machine Learning. We identified all non-patent references on patents related to this technology issued between 2004 and 2023. We then determined the science publishers responsible for the largest number of these non-patent references. Figure 3 shows the result of this analysis, namely that IEEE science is referenced far more in AI related patents than science from any other publisher. 31.01% of all science references from these patents go to IEEE journal papers or IEEE sponsored conference papers (the graphs also include standards documents, but most of the references are to journal or conference papers). In second place is the ACM with 8.74% of the references.

AI is currently a very hot area and often written about in the popular press. The same can be said for Autonomous Vehicles which are shown in Figure 4. Here again IEEE dominates in references. In this case almost half (48.52%) of all references are to IEEE in this category. IEEE receives about 10 times as many references from autonomous vehicles as second place Elsevier.

Blockchain and Distributed Ledgers is a relatively new category with only a few thousand patents (as opposed to AI which is a much more established category with 40,000+ patents). We see in Figure 5 that 4,086 (38.97%) of all science references from these patents go to IEEE. This is approximately 4 times as many as second place ACM with 997 (9.51%) of all references.

Figure 6 covers Broadcasting patents, which consists of US patents in the IPCs for Broadcast Communication and Pictorial Communication (Television). It would seem that this would be an area that is somewhat tangential to IEEE's core mission. However, IEEE leads in references in this category as well with 30.07%. The International Telecommunications Union is a distant second with 13.18% of all references.

Figures 7 and 8 show referencing patterns from Computer Hardware and Software patents. Here IEEE once again receives far more references than the other publishers. In both cases, ACM is the second most referenced publisher, but it receives about half of the references that papers published by IEEE receive.

Figure 9 shows references in the fast-growing area of Cybersecurity. This is a very hot area with a lot of recent patent growth, and again IEEE leads by a wide margin (28.18% of all references compared to 15.05% for second place ACM).

Figure 10 examines the top referenced publishers in the Medical Device field, which covers devices as well as diagnostic tools and surgical instruments. Here, IEEE is a respectable fourth in an area that is outside its core competency. RELX who has more than 400 journals in the field, such as *Annals of Thoracic Surgery*, and the *Journal of the American College of Cardiology* has a substantial lead with 19.94% of all references. Wiley with 9.91% of references and Wolters Kluwer (parent of Lippincott) with 8.45% of references are just ahead of IEEE's 8.01% of references in the category. (IEEE is slightly up from 7.78% of the references in last year's report for this category.)

Figure 11 contains the results for the information storage category. In this area, IEEE is particularly dominant. 41.12% of all the science references from patents in information storage are to papers in IEEE journals or conferences. IEEE's 91,925 references in this category are about six times as many as second place ACM.

Another hot technology area consists of Internet-of-Things patents. As Figure 12 shows, IEEE science is very important to the development of this new and active area of patenting. More than 36% of all science references are to IEEE content. 3GPP (a standards body) is a distant second with 12.44% of all references.

Figure 13 contains the results of patents covering Measuring, Testing, and Control technology. Patents in this category are related to measuring or testing force, pressure, weight, etc. as well as chemically measuring substances (e.g. measuring CO<sub>2</sub> levels). The category also contains control devices since these technologies are often combined. For example, a patent might be related to a valve that adjusts at a certain pressure or at a certain pollution level. Since this type of measuring can be done both mechanically, magnetically, electrically, or chemically, it is not too surprising to see both IEEE and RELX and the Optical and Chemical Societies all near the top of Figure 13. IEEE receives the most references, but the lead is not as dominant as in the Information Technology related technology areas.

The results for the Optics category can be found in Figure 14. This is another area that is slightly outside the IEEE core. In this case IEEE is sandwiched between the two major optics societies. The Optical Society of America (OSA) leads with 39,621 science references, IEEE is second with 31,955 and the International Society of Optical Engineering (SPIE) is third with 29,440 references from optics patents.

Figure 15 contains results for the patents related to power generation and transmission. Although this is a non-information technology category, IEEE leads in references in this category as well. 30.80% of science references from patents in this category go to IEEE publications. RELX is second with 21.70% of all US patent references in the category.

Intelligent Manufacturing and Robotics contains patents related to robotics, and robotics and control systems related to manufacturing. According to Markets and Markets [8], service robotics market is projected to reach USD 103.3 billion by 2026 because of a population explosion in service robots that mow lawns, vacuum floors, and manufacture things.

As this industry grows, new innovations will be patented, and from Figure 16 it looks like those innovations will build upon ideas published in IEEE journal articles or presented at IEEE conferences. We see that 36.97% of all science references from patents in this space refer to IEEE published articles. RELX is the second ranked publisher, but its papers receive only 9.27% of the science references. In this category, IEEE has more references than the next dozen publishers combined.

Figure 17 shows that IEEE is also very strong in the Semiconductor category. Here, the inclusion of conferences gives IEEE a substantial boost. Approximately one-third of the references to IEEE are to conference papers. With conferences excluded, IEEE would be about the same level as the American Institute of Physics in terms of science references from semiconductor patents.

The Smart Meter/Smart Grid category covers patents related to improving the power grid as well as for advanced residential electric meters. This is a relatively small category but as we see in Figure 18, the IEEE provides the bulk of the science base with over half of all patent references.

Solar and Photovoltaic energy results are contained in Figure 19. IEEE holds a lead over RELX in this category in spite of having fewer journal titles. RELX has several strong journals in this category including *Solar Energy Materials and Solar Cells*, *Thin Solid Films*, *Solar Energy*, *Synthetic Metals*, *Journal of Crystal Growth*, *Solar Cells*, plus more than 50 smaller journal titles

related to this technology. The references to IEEE science in this category mainly go to the *IEEE Photovoltaic Specialists conference*, the *IEEE World conference on Photovoltaic Energy Conversion*, and *IEEE Transactions on Electronic Devices*.

The Telecommunications category is one of the strongest large categories for IEEE. IEEE articles receive more references than the next three publishers, (all of which are standards bodies). Standards are referenced more frequently in telecommunications than in other categories. About 36% of the 1.8 million total references are to standards documents with the other 64% going to journal and conference articles. In terms of standards documents, the 3GPP General Partnership Project, Internet Engineering Task Force and International Telecommunication Union received the most references in the category.

New telecommunications patents are referencing scientific articles to a larger extent than in the past. In last year's report this figure showed 706,000+ references to IEEE articles for the 20-year span of 2004-2023. Now as we see in Figure 20, there are more than 737,000+ references to IEEE for telecommunications patents in the 20-year period 2004-2023.

Standards documents are referenced increasingly often in Telecommunications patents. Six of the top 20 referenced publishers are standards bodies. Moreover, of the 737,000+ references to IEEE, over 74,000 are to various IEEE standards (mostly to the IEEE 802 family of standards).

Virtual and Augmented Reality is another relatively small but hot category. We see in this category that again IEEE leads by a wide margin with 30.15% of all science references from patents. ACM is in second place with 17.04% of references.

Wind Energy is another relatively small area where IEEE has a big lead. We see in Figure 22 that in this area 39.26 of all science references from Wind Energy patents go to IEEE journal and conference papers. This is about 2.5 times as many references as second place RELX receives, despite IEEE having fewer journal titles in the area than RELX does.

Figures 3-22 show aggregate counts of references from all patents in each technology category. Readers who wish to see the firms that reference IEEE publications in each category can consult Appendix B. This appendix contains the 100 organizations that reference IEEE most frequently in each category. Appendix C is similar, except that it contains the organizations that reference IEEE most frequently in the twenty technology categories combined.

### ***Citation Index for Patents Referencing IEEE***

In an earlier study (see [2]) it was shown that patents that reference specific IEEE journals perform better on a number of quality metrics. Moreover, it was shown that the results were statistically significant. In this report, we update a key figure from the previous study showing the citation index of patents that reference IEEE papers versus peer patents that do not reference IEEE.

The citation index is a normalized citation metric that takes the number of citations received by a particular set of patents and divides it by the expected number of citations for patents of the same

age and technology class. A random set of patents therefore should have a citation index of 1.0. Research has shown that patents cited by many later patents tend to contain important ideas upon which the later patents are building (see [3] and [6]). Citation indicators are also the basis for the patented financial models (see [4] and [7]) invented by the two 1790 founders Breitzman and Thomas.

Figure 23 contains the Citation Index for the patents in the twenty technology categories that reference IEEE papers and conferences. Also shown is the Citation Index for the set of the remaining patents in each category that do not reference IEEE. Note that the set of all patents in each category have an expected citation index of 1.0. Thus, we see that the patents that reference IEEE are cited sometimes 3 to 4 times more often than expected, while the patents that do not reference IEEE are cited up to 10% less often than expected in some categories. This of course does not imply that all patents that reference IEEE are likely to be more valuable than patents that do not reference IEEE, but it does suggest that in general, patented technologies that build upon IEEE published or sponsored science are more likely to be valuable than patented technologies that do not reference IEEE science.

## IV. Conclusions

When a patent is filed, it must reference the prior art upon which it builds, as well as any prior art that limits the claims of the new invention. This study and prior studies show that science published by IEEE forms a significant portion of this prior art for new patents.

In this study, we examined two separate patent sets. The first patent set consisted of patents granted between 2004 and 2023 to the 50 organizations with the largest number of US patents granted in 2023. The second patent set consisted of all US patents granted between 2004 and 2023 in twenty key technologies: Artificial Intelligence, Autonomous Vehicles, Cybersecurity, and several other categories. In most of these patent sets IEEE is the dominant source of non-patent prior art. In other words, IEEE journals and conferences are key outlets for scientific discoveries relevant to cutting edge technology.

Finally, we conducted an analysis of citation indices for IEEE related patents and non-IEEE related patents. These types of metrics have been shown in validation studies to be good markers for the quality, impact, and potential value of patents [3]. In this study, it was shown that patents that build upon IEEE published science tend to have higher citation indices than patents that do not reference IEEE. This suggests but does not guarantee that patents that build upon IEEE science are more likely to become high-quality, high-impact, valuable inventions than patents that do not build upon IEEE.

Specific key results are identified in the Executive Summary.

Decision feedback equalizer using soft decisions

## Abstract

A decision feedback equalizer (DFE) and method include at least two paths. Each path includes the following. An adder is configured to sum an input with a first feedback tap fed back from a different path. A latch is coupled to the adder to receive a summation signal as input. The latch includes a transparent state, and an output of the latch is employed as the first tap in a feedback path to an adder of a different path, wherein a partially resolved first tap in the feedback path is employed during the transparent state to provide a soft decision to supply correction information in advance of a hard decision of the latch.
